

Case Management

Psychiatric and Psychosomatic Illness

Optimal care results for patients and health care providers

According to the World Health Organization (WHO) depressions are predicted to become the second most frequent illness diagnosis in the year 2020. The continuous increase for psychiatric and psychosomatic illness leads to high cost expenditures for the health care sector.

To avoid the occurrence of inappropriate health care services in the outpatient area, chronicity, relapse, intensive and long-term cost-of-illness, we orchestrate a care management approach that merges different health care aspects to deliver

- optimal care results,
- effective treatment,
- state-of-the-art quality care that ensures successful cures and
- well-founded economic solutions.

Enhance your potential

Analyses and conceptual design

We investigate the health care insurance provider's potential for case-control and care management regulations. The results are transformed into specially tailored concepts and delivered to providers of reimbursement services, insurance consulting services, validation services and case and care management.

Outpatient case management

We recognize early illness indicators, such as work incapacity and sick-pay cases. In the initial stage of the illness the patients are approached to ensure they receive the most optimal care and that a speedy recovery for returning to their work environment is guaranteed. In effect, an increase in morbidity and cost intensive follow-up treatments are avoided.

Hospital case management

We examine inpatient psychiatric and psychosomatic treatment in hospitals and secure the patient's subsequent discharge into a stable outpatient environment. Our aim is to optimize hospital care by interlocking efficient economic standards with the best medical treatment.

Intensive care management

We provide acute consulting and intervention services for health care recipients, who have consumed comprehensive health care benefits over a long period of time. This includes managing the patient's immediate medical environment by working together with hospitals, health care insurance providers, medical and social service providers as well as offering telephone support hotlines for specific outpatient needs. In this way, we initialize the process for a fast occupational rehabilitation and thus achieve a stabilization of the illness.

Our competence

Our expert team includes physicians, psychologists, social psychiatrists, social workers that encompass the following areas

- Comprehension of clinical expertise
- Performance of quality-oriented case management processes
- Management of client-oriented workflows and interfaces
- Competence in software, IT technology, and data security development
