

Checkpad MED®

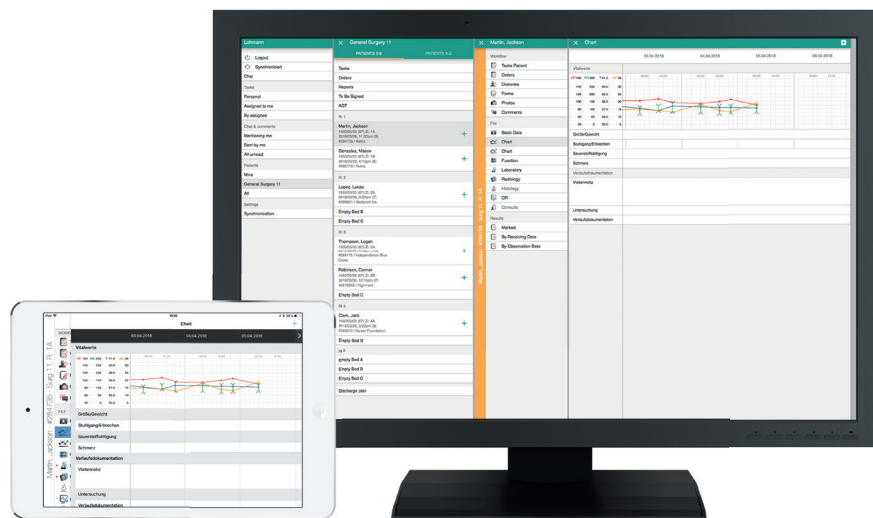

Better Health Care through the Digital Patient Record

Checkpad MED is a patient record system for multiple platforms that improves medical workflows in various health care facilities around the world. With its unique ability to work offline, physicians can view and add patient information on their portable device anywhere, anytime. This provides medical workers in rural communities with similar access to information to those practicing in metropolitan areas. In addition every physician or nursing staff can work from every computer in the hospital or another workplace through an ordinary web browser.

The technology communicates with the health-care facilities server and electronic health information system using Health Level Seven (HL7) standards to ensure seamless integration. Data is encrypted and transmitted through secure connections via any network (WiFi/4G/LTE).

The iOS based application is protected on two levels through the device (FaceID, TouchID or PIN) and the applications user-specific password. User access to patients' data can be regulated individually and through different user groups thus enabling different health-care professionals working on the same platform and patient. The technology also integrates data from medical devices and wearables to be inserted into patients records.

Enhancing the functionality of stationary record systems, Checkpad MED focuses on the availability of medical data at the point of care. This concept appeals likewise to medical workers and patients who seek for professional medical care regardless of the location.

Checkpad MED® as a Digital Chart

Now the documentation of the patient's vital signs as well as his medication plan is feasible directly during the daily rounds. No more time-wasting based on postprocessing. It's also possible to order treatments such as blood tests.

The workflow is optimized and there is more time for the patient by completing forms and generate team tasks. Checkpad MED supports the whole treatment process and every clinician has the same information status of their patients.
